

Interactive Web Apps with shiny Cheat Sheet

learn more at shiny.rstudio.com

Basics

A **Shiny** app is a web page (**UI**) connected to a computer running a live R session (**Server**)

Users can manipulate the UI, which will cause the server to update the UI's displays (by running R code).

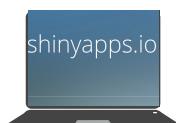

App template

Begin writing a new app with this template. Preview the app by running the code at the R command line.

```
library(shiny)
ui <- fluidPage()
server <- function(input, output){}
shinyApp(ui = ui, server = server)
```

- **ui** - nested R functions that assemble an HTML user interface for your app
- **server** - a function with instructions on how to build and rebuild the R objects displayed in the UI
- **shinyApp** - combines **ui** and **server** into a functioning app. Wrap with **runApp()** if calling from a sourced script or inside a function.

Share your app

 shinyapps.io The easiest way to share your app is to host it on shinyapps.io, a cloud based service from RStudio

1. Create a free or professional account at <http://shinyapps.io>
2. Click the **Publish** icon in the RStudio IDE (>=0.99) or run:
`rsconnect::deployApp("<path to directory>")`

Build or purchase your own Shiny Server
at www.rstudio.com/products/shiny-server/

Building an App - Complete the template by adding arguments to `fluidPage()` and a body to the `server` function.

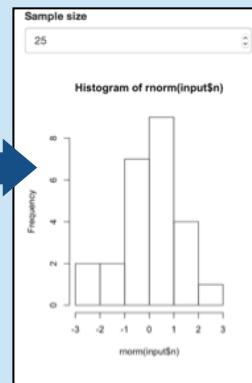

Add inputs to the UI with `*Input()` functions

Add outputs with `*Output()` functions

Tell server how to render outputs with R in the server function. To do this:

1. Refer to outputs with `output$<id>`
2. Refer to inputs with `input$<id>`
3. Wrap code in a `render*`() function before saving to output

```
library(shiny)
ui <- fluidPage(
  numericInput(inputId = "n",
    "Sample size", value = 25),
  plotOutput(outputId = "hist")
)
server <- function(input, output) {
  output$hist <- renderPlot({
    hist(rnorm(input$n))
  })
}
shinyApp(ui = ui, server = server)
```

Save your template as **app.R**. Alternatively, split your template into two files named **ui.R** and **server.R**.

```
library(shiny)
ui <- fluidPage(
  numericInput(inputId = "n",
    "Sample size", value = 25),
  plotOutput(outputId = "hist")
)
server <- function(input, output) {
  output$hist <- renderPlot({
    hist(rnorm(input$n))
  })
}
shinyApp(ui = ui, server = server)
```

```
# ui.R
fluidPage(
  numericInput(inputId = "n",
    "Sample size", value = 25),
  plotOutput(outputId = "hist")
)

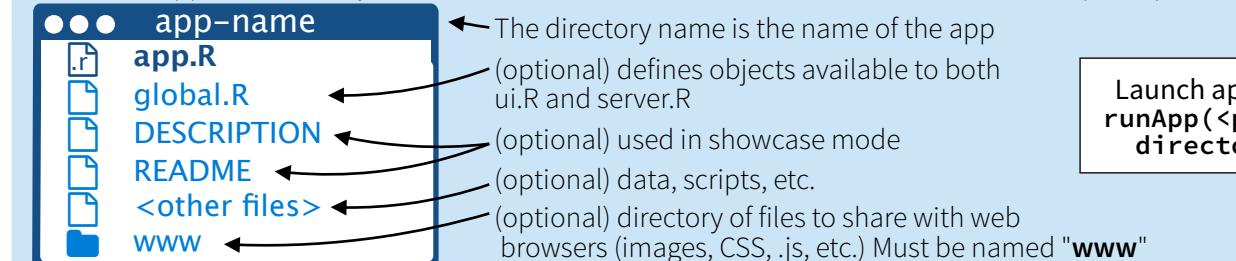

# server.R
function(input, output) {
  output$hist <- renderPlot({
    hist(rnorm(input$n))
  })
}
```

ui.R contains everything you would save to ui.

server.R ends with the function you would save to server.

No need to call `shinyApp()`.

Save each app as a directory that contains an **app.R** file (or a **server.R** file and a **ui.R** file) plus optional extra files.

Launch apps with
`runApp(<path to directory>)`

Inputs - collect values from the user

Access the current value of an input object with `input $<inputId>`. Input values are **reactive**.

Action

`actionButton(inputId, label, icon, ...)`

Link

`actionLink(inputId, label, icon, ...)`

Choice 1
 Choice 2
 Choice 3

Check me

`checkboxGroupInput(inputId, label, choices, selected, inline)`

`checkboxInput(inputId, label, value)`

`dateInput(inputId, label, value, min, max, format, startview, weekstart, language)`

`dateRangeInput(inputId, label, start, end, min, max, format, startview, weekstart, language, separator)`

`fileInput(inputId, label, multiple, accept)`

1

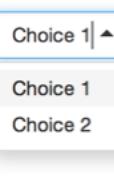

`numericInput(inputId, label, value, min, max, step)`

.....

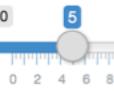

`passwordInput(inputId, label, value)`

Choice A
 Choice B
 Choice C

`radioButtons(inputId, label, choices, selected, inline)`

`selectInput(inputId, label, choices, selected, multiple, selectize, width, size) (also selectizeInput())`

`sliderInput(inputId, label, min, max, value, step, round, format, locale, ticks, animate, width, sep, pre, post)`

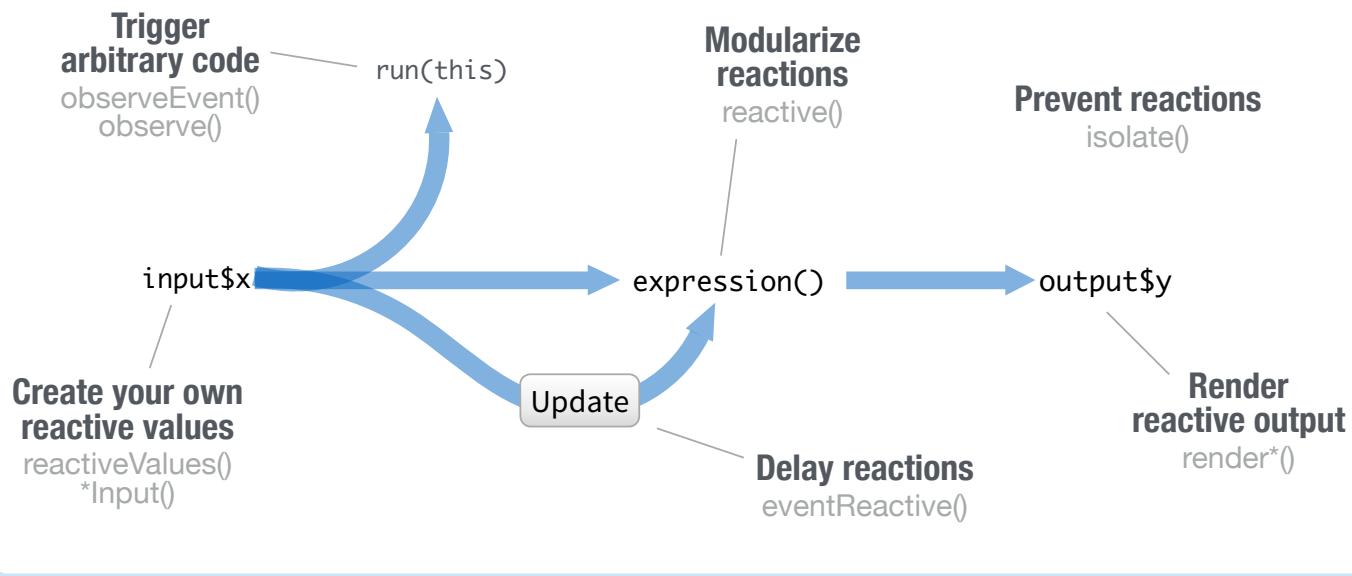

`submitButton(text, icon) (Prevents reactions across entire app)`

Enter text

`textInput(inputId, label, value)`

Reactivity

Reactive values work together with reactive functions. Call a reactive value from within the arguments of one of these functions to avoid the error [Operation not allowed without an active reactive context](#).

Create your own reactive values

```
library(shiny)

ui <- fluidPage(
  textInput("a", ""))
  
server <- function(input, output){
  rv <- reactiveValues()
  rv$number <- 5
}
shinyApp(ui, server)
```

***Input()** functions
(see front page)
reactiveValues(...)

Each input function creates a reactive value stored as **input\$<inputId>**
reactiveValues() creates a list of reactive values whose values you can set.

Render reactive output

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""))
  
server <- function(input, output){
  output$b <- renderText({
    input$a
  })
}
shinyApp(ui, server)
```

render*() functions
(see front page)

Builds an object to display. Will rerun code in body to rebuild the object whenever a reactive value in the code changes.

Save the results to **output\$<outputId>**

Prevent reactions

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  textOutput("b"))
  
server <- function(input, output){
  output$b <- renderText({
    isolate({input$a})
  })
}
shinyApp(ui, server)
```

isolate(expr)
Runs a code block. Returns a non-reactive copy of the results.

Trigger arbitrary code

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  actionButton("go", ""))
  
server <- function(input, output){
  observeEvent(input$go, {
    print(input$a)
  })
}
shinyApp(ui, server)
```

observeEvent(eventExpr, handlerExpr, event.env, event.quoted, handler.env, handler.quoted, label, suspended, priority, domain, autoDestroy, ignoreNULL)

Runs code in 2nd argument when reactive values in 1st argument change. See **observe()** for alternative.

Modularize reactions

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  textInput("z", ""))
  
server <- function(input, output){
  re <- reactive({
    paste(input$a, input$b)
  })
  output$b <- renderText({
    re()
  })
}
shinyApp(ui, server)
```

reactive(x, env, quoted, label, domain)
Creates a reactive expression that

- caches its value to reduce computation
- can be called by other code
- notifies its dependencies when it has been invalidated

Call the expression with function syntax, e.g. **re()**

Delay reactions

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  actionButton("go", ""))
  
server <- function(input, output){
  re <- eventReactive(
    input$go, {input$a})
  output$b <- renderText({
    re()
  })
}
shinyApp(ui, server)
```

eventReactive(eventExpr, valueExpr, event.env, event.quoted, value.env, value.quoted, label, domain, ignoreNULL)

Creates reactive expression with code in 2nd argument that only invalidates when reactive values in 1st argument change.

UI

An app's UI is an HTML document. Use Shiny's functions to assemble this HTML with R.

```
fluidPage(
  textInput("a", ""))
## <div class="container-fluid">
##   <div class="form-group shiny-input-container">
##     <label for="a"></label>
##     <input id="a" type="text"
##           class="form-control" value="" />
##   </div>
## </div>
```

Returns HTML

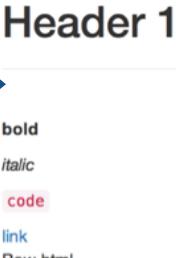

Add static HTML elements with **tags**, a list of functions that parallel common HTML tags, e.g. **tags\$a()**. Unnamed arguments will be passed into the tag; named arguments will become tag attributes.

tags\$a	tags\$data	tags\$h6	tags\$nav	tags\$span
tags\$abbr	tags\$datalist	tags\$head	tags\$object	tags\$strong
tags\$address	tags\$dd	tags\$header	tags\$optgroup	tags\$style
tags\$area	tags\$del	tags\$group	tags\$ol	tags\$sub
tags\$article	tags\$details	tags\$hr	tags\$option	tags\$summary
tags\$aside	tags\$dfn	tags\$HTML	tags\$output	tags\$sup
tags\$audio	tags\$div	tags\$i	tags\$p	tags\$table
tags\$b	tags\$dl	tags\$iframe	tags\$param	tags\$tbody
tags\$base	tags\$dt	tags\$img	tags\$pre	tags\$td
tags\$bdi	tags\$em	tags\$input	tags\$progress	tags\$textarea
tags\$bdo	tags\$embed	tags\$ins	tags\$q	tags\$tfoot
tags\$blockquote	tags\$events	tags\$kbd	tags\$keygen	tags\$th
tags\$body	tags\$fieldset	tags\$label	tags\$rp	tags\$thead
tags\$br	tags\$figcaption	tags\$figure	tags\$rt	tags\$time
tags\$button	tags\$button	tags\$footer	tags\$rt	tags\$title
tags\$canvas	tags\$caption	tags\$form	tags\$s	tags\$tr
tags\$caption	tags\$cite	tags\$h1	tags\$amp	tags\$track
tags\$code	tags\$code	tags\$h2	tags\$script	tags\$u
tags\$col	tags\$col	tags\$h3	tags\$section	tags\$ul
tags\$colgroup	tags\$colgroup	tags\$h4	tags\$select	tags\$var
tags\$command	tags\$command	tags\$small	tags\$meta	tags\$video
		tags\$h5	tags\$source	tags\$wbr

The most common tags have wrapper functions. You do not need to prefix their names with **tags\$**

```
ui <- fluidPage(
  h1("Header 1"),
  hr(),
  br(),
  p(strong("bold")),
  p(em("italic")),
  p(code("code")),
  a(href="", "link"),
  HTML("<p>Raw html</p>"))
```

To include a CSS file, use **includeCSS()**, or 1. Place the file in the **www** subdirectory 2. Link to it with

```
tags$head(tags$link(rel = "stylesheet",
  type = "text/css", href = "<file name>"))
```

To include JavaScript, use **includeScript()** or 1. Place the file in the **www** subdirectory 2. Link to it with

```
tags$head(tags$script(src = "<file name>"))
```

IMAGES To include an image

- Place the file in the **www** subdirectory
- Link to it with **img(src=<file name>")**

Layouts

Combine multiple elements into a "single element" that has its own properties with a panel function, e.g.

```
wellPanel(
  dateInput("a", ""),
  submitButton()
)
```

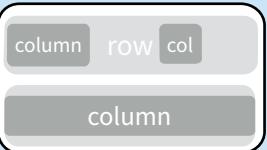

absolutePanel()
conditionalPanel()
fixedPanel()
headerPanel()

inputPanel()
mainPanel()
navlistPanel()
sidebarPanel()

tabPanel()
tabsetPanel()
titlePanel()
wellPanel()

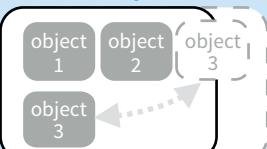

Organize panels and elements into a layout with a layout function. Add elements as arguments of the layout functions.

fluidRow()

```
ui <- fluidPage(
  fluidRow(column(4),
    column(width = 2, offset = 3),
    fluidRow(column(12)))
```

flowLayout()

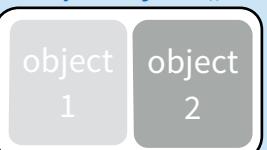

```
ui <- fluidPage(
  flowLayout(object1,
            object2,
            object3))
```

sidebarLayout()

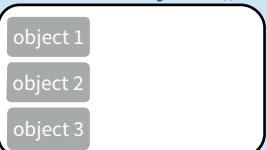

```
ui <- fluidPage(
  sidebarLayout(sidePanel,
                mainPanel))
```

splitLayout()

```
ui <- fluidPage(
  splitLayout(object1,
              object2))
```

verticalLayout()

```
ui <- fluidPage(
  verticalLayout(object1,
                 object2,
                 object3))
```

Layer tabPanels on top of each other, and navigate between them, with:
